**Parkinson’s Disease and Movement Disorders** - Charles H. Adler - 2000-04-07
The field of movement disorders is relatively broad, encompassing disorders of increased movement, such as tremors, dystonia, and tics, to disorders characterized by a paucity of movement, such as Parkinson’s disease. Our understanding of the pathogenic mechanisms and our treatment options are expanding at a rapid pace. This expansion ranges from the medical and surgical advances in treating Parkinson’s disease to the flood of genetic abnormalities that have now been found to cause various movement disorders. Although many patients are seen by the movement disorders specialist in neurology clinics around the country, most of these patients receive their followup care from a primary care physician or “general” neurologist who must be versed in the characteristics and treatment plans of this diverse group of disorders. The major goal of Parkinson’s Disease and Movement Disorders: Diagnosis and Treatment Guidelines for the Practicing Physician is to distill this immense amount of information and to educate the practitioner about the many facets of the movement disorders field. We believe that this book fills a large void, since most texts on movement disorders are more detailed and geared toward the specialist. We have asked the chapter authors to emphasize the clinical characteristics of each disorder, discuss the differential diagnosis and the diagnostic testing, and then outline the various treatment options, as if they were teaching during a preceptorship in their clinic.
Management of Motor Speech Disorders in Children and Adults - movement disorders are more detailed and geared toward the specialist. We have asked the chapter authors to emphasize the clinical characteristics of each disorder, discuss the differential diagnosis and the diagnostic testing, and then outline the various treatment options, as if they were teaching during a preceptorship in their clinic.

Dynamic Evaluation of Motor Speech Skill (DEMSS) is a criterion-referenced assessment designed to help with differential diagnosis of speech sound disorders in children with severely impaired speech production. Developed by one of the leading experts on childhood apraxia of speech (CAS) and an expert on test development, this tool is an efficient way to assess children who have significant speech impairment, especially reduced phonemic and/or phonetic inventories, vowel or prosodic errors, poor speech intelligibility, and/or little to no verbal communication. USE DEMSS TO Diagnose severe speech sound disorders in children 3 and older Facilitate, confirm, or rule out a diagnosis of CAS Estimate the severity of a child’s disorder and what their prognosis might be Inform the development of treatment goals Make decisions about the most effective methods of cueing during treatment How It Works DEMSS is a dynamic assessment administered by SLPs in a clinical setting, usually in about 30 minutes or less. The child is tested on production of 60 utterances, divided into eight grouped sets according to syllable structure. For each item on the DEMSS, the SLP provides a verbal model, asks the child for a direct imitation, and follows up with more cues and supports if the child’s first attempt is incorrect. Scoring takes into account overall accuracy in producing the word, vowel accuracy, consistency of production, and accuracy of prosodic features of the word. After administering DEMSS and determining results, SLPs can schedule a follow-up meeting with the child’s parents to share results and make recommendations. Clear and comprehensive guidance is available to DEMSS users. The manual walks SLPs through every step of test administration and scoring, as well as interpretation. The accompanying video tutorial gives users a helpful overview of DEMSS and guides them through two administrations of the entire tool with two different patients: one with mild CAS and one with more severe CAS. Purchase the DEMSS manual and get everything you need! The manual includes a keycode that unlocks access to the video tutorial and free unlimited DEMSS forms, downloadable online.

The Connections Between Language and Reading Disabilities - Hugh
W. Catts - 2005-01-15
This is an edited book based on papers presented at a 2003 invitee-only
conference under the sponsorship of the Merrill Advanced Studies Center of
the University of Kansas. The participants were prominent scholars in the
areas of language and reading, and have research programs funded by NIH
and other sources. The purpose of the gathering was to discuss theoretical
developmental language and reading disabilities, specifically looking at
neurological, behavioral, and genetic factors. In addition, it discussed other
factors contributing to reading difficulties in the middle elementary school
years through adolescence and literacy outcomes for children with early
language impairments, and how these problems relate to children with
dyslexia. The Foreword is written by Reid Lyon, Branch Chief, Child
Development and Behavior Branch, NICHD-National Institutes of Health.
This book appeals to scholars in the areas of language disorders and
reading disabilities, as well as to practicing speech-language pathologists,
special educators, and reading specialists. It may also be used in graduate
courses designed as seminars in either language disorders or reading
disabilities in schools of communication disorders, as well as schools of
education—especially special education departments.
